Vocabularies

Vocabularies

- ▶ Data integration needs agreements on
 - terms
 - “translator”, “author”
 - categories used
 - “Person”, “literature”
 - relationships among those
 - “an author is also a Person...”, “historical fiction is a narrower term than fiction”
 - ie, new relationships can be deduced

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

Vocabularies

- ▶ There is a need for “languages” to define such vocabularies
 - to define those vocabularies
 - to assign clear “semantics” on how new relationships can be deduced 指定明确的“语义”，说明如何推导出新的关系。

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

Classes, resources, ...

- ▶ Think of well known traditional vocabularies:
 - use the term “novel”
 - “every novel is a fiction”
 - “«The Glass Palace» is a novel”
 - etc.
- ▶ RDFS defines resources and classes:
 - everything in RDF is a “resource”
 - “classes” are also resources, but...
 - ...they are also a collection of possible resources (i.e., “individuals”)
 - “fiction”, “novel”, ...

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

Classes, resources, ... (cont.)

- ▶ Relationships are defined among resources:
 - “typing”: an individual belongs to a specific class
 - “«The Glass Palace» is a novel”
 - to be more precise: “<http://.../000651409X>” is a novel”
 - “subclassing”: all instances of one are also the instances of the other (“every novel is a fiction”)
- ▶ RDFS formalizes these notions in RDF

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

- ▶ RDFS defines the meaning of these terms
 - (these are all special URI-s, we just use the namespace abbreviation)

→ Worksheet #3: Tasks 1 & 2

Reuse vocabularies whenever possible

René Witte

Use well-known and authoritative vocabularies to describe things whenever possible.

Describe common types of data by using terms from core vocabularies.

Use authoritative vocabularies for terms not defined by the core vocabularies.

Create your own vocabulary if necessary.

Use RDFS and OWL.

Be prepared to maintain it.

Core Vocabularies

René Witte

Use terms from these core vocabularies to describe commonly understood data.

- ? Naming things? ← Use rdfs:label, foaf:name, skos:prefLabel.
- ? Describing people? ← Use FOAF, vCard.
- ? Describing addresses? ← Use vCard.
- ? Describing projects? ← Use Description of a Project (DOAP).
- ? Describing web pages and other publications? ← Use dc:creator and dc:description.
- ? Describing an RDF vocabulary? ← Use a VoID description.
- ? Describing existing taxonomies? ← Use SKOS.

- See also
 - Authoritative vocabularies.vdk
- Links to core vocabularies

More authoritative vocabularies

René Witte

Use these authoritative vocabularies to describe data you couldn't describe with the core vocabularies.

See also
Core vocabularies.vdk

- Specifying the geographical location of something? ← Use Geo.
- Describing citations and bibliographic references? ← Use BIBO.
- Describing copyright licenses? ← Use the Creative Commons Rights Expression Language
- Describing a place? ← Use GeoNames.
- Describing product, price, or company data? ← Use Good Relations.
- Describing web resources that are compound digital objects? ← Use Object Reuse and Exchange.
- Describing information about an online community? ← Use SIOC.

- Links to authoritative vocabularies
- BIBO
 - Creative Commons Rights Expression Language.
 - Geo
 - GeoNames
 - Good Relations

[Other SPARQL Features](#)

[SPARQL Protocol](#)

[Named Graphs](#)

[Serving Knowledge Graphs](#)

[Inferencing](#)

[Notes and Further](#)

[Reading](#)

Term equivalences

▶ For individuals:

- **owl:sameAs**: two URIs refer to the same concept (“individual”)
- **owl:differentFrom**: negation of owl:sameAs

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

Other example: connecting to French

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

Typical usage of owl:sameAs

- ▶ Linking our example of Amsterdam from one data set (DBpedia) to the other (Geonames):

```
<http://dbpedia.org/resource/Amsterdam>
owl:sameAs <http://sws.geonames.org/2759793>;
```

- ▶ This is the main mechanism of “Linking” in the Linked Open Data project

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

→ Worksheet #3: Task 3

Property characterization

在OWL中，人们可以对属性的行为进行表征（对称性、反转性、功能性、逆功能性、反身性、非反身性.....）

- ▶ In OWL, one can characterize the behavior of properties (symmetric, transitive, functional, inverse functional, reflexive, irreflexive, ...)
- ▶ OWL also separates data and object properties
 - “datatype property” means that its range are typed literals

[Introduction](#)

[Review](#)

[OWL](#)

[Queries](#)

[Introduction](#)

[Describe](#)

[Select](#)

[Construct](#)

[Ask](#)

[Other SPARQL Features](#)

[SPARQL Protocol](#)

[Named Graphs](#)

[Serving Knowledge Graphs](#)

[Inferencing](#)

[Notes and Further](#)

[Reading](#)

Characterization example

- ▶ “foaf:email” may be defined as “inverse functional”
 - i.e., two different subjects cannot have identical objects
即两个不同的主体不可能有相同的对象。

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

What this means is...

-
- ▶ If the following holds in our triples:

```
:email rdf:type owl:InverseFunctionalProperty.
```

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

What this means is...

- ▶ If the following holds in our triples:

```
:email rdf:type owl:InverseFunctionalProperty.  
<A> :email "mailto:a@b.c".  
<B> :email "mailto:a@b.c".
```

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

What this means is...

- ▶ If the following holds in our triples:

```
:email rdf:type owl:InverseFunctionalProperty.
<A> :email "mailto:a@b.c".
<B> :email "mailto:a@b.c".
```

then, processed through OWL, the following holds,
too:

因为此处规定有inverseFunctionalProperty, 但
是A, B邮箱相同, 因此A, B必定为同一对象

```
<A> owl:sameAs <B>.
```

[Introduction](#)
[Review](#)
[OWL](#)
[Queries](#)
[SPARQL Queries](#)
[Introduction](#)
[Describe](#)
[Select](#)
[Construct](#)
[Ask](#)
[Other SPARQL Features](#)
[SPARQL Protocol](#)
[Named Graphs](#)
[Serving Knowledge Graphs](#)
[Inferencing](#)
[Notes and Further](#)
[Reading](#)

Inverse properties

- ▶ There may be an inverse relationship among properties, eg:

```
<somebook> ex:author <somebody>.  
ex:author owl:inverseOf ex:authorOf.
```

yields, in OWL:

```
<somebody> ex:authorOf <somebook>.
```

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

Classes in OWL

- ▶ In RDFS, you can subclass existing classes... that's all
- ▶ In OWL, you can construct classes from existing ones:
 - enumerate its content
 - through intersection, union, complement
 - etc

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

OWL DL and Description Logic

- ▶ OWL DL can be interpreted as a variant of Description Logic *owl:DL*可以被解释为描述逻辑的变体。
 - for connoisseurs: OWL (2) DL \approx SROIQ(D)
- ▶ Hence the results of this particular area of logic are directly applicable

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

Description Logic Formalism

- ▶ There is also a compact mathematical notation for axioms, assertions, etc:
 ■ Literature ≡ Novel \sqsubseteq Short_Story \sqsubseteq Poetry
 ■ Listed_Price \sqsubseteq \forall currency.Currencies
- ▶ You may see these in papers, books...

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

Ontologies examples

- ▶ eClassOwl: eBusiness ontology for products and services, 75,000 classes and 5,500 properties
- ▶ National Cancer Institute's ontology: about 58,000 classes
- ▶ Open Biomedical Ontologies Foundry: a collection of ontologies, including the Gene Ontology to describe gene and gene product attributes in any organism or protein sequence and annotation terminology and data (UniProt)
- ▶ BioPAX: for biological pathway data

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

Querying RDF graphs

- ▶ Remember the Python+RDFLib idiom:

```
for (s,p,o) in graph.triples((subject,None,None)) :  
    do_something(p,o);
```

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

Querying RDF graphs

- ▶ In practice, more complex queries into the RDF data are necessary
 - something like: “give me the (a,b) pair of resources, for which there is an x such that (x parent a) and (b brother x) holds” (ie, return the uncles)
 - these rules may become quite complex
- ▶ The goal of SPARQL (Query Language for RDF)

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

Analyze the Python+RDFLib example

```
for (s,p,o) in graph.triples((subject,None,None)) :  
    do_something(p,o);
```

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

General: graph patterns

- ▶ The fundamental idea: use graph patterns
 - the pattern contains unbound symbols
 - by binding the symbols, subgraphs of the RDF graph are selected
 - if there is such a selection, the query returns the bound resources

基本思路：利用图形模式

§ 该模式包含未绑定的符号

§ 通过绑定符号，选择RDF图的子图

§ 如果有这样的选择，查询返回绑定的资源。

[Introduction](#)

[Notes and Further](#)

[Reading](#)

Our Python example in SPARQL

```
SELECT ?p ?o
WHERE {subject ?p ?o}
```

- ▶ The triples in WHERE define the graph pattern, with ?p and ?o “unbound” symbols
WHERE中的三组定义了图形模式，其中?p和?o为“未绑定”符号。
- ▶ The query returns all p,o pairs

Introduction

SPARQL W3C Standard

SPARQL stands for...

"SPARQL Protocol And RDF Query Language"

- Current version 1.1 (like RDF, RDFS, etc.)
- Language for querying graphs
- and a protocol for doing this over the web using a [SPARQL endpoint](#)
- Major difference between 1.0 and 1.1: modifying graphs via SPARQL (insert, delete etc.)

<https://www.w3.org/TR/sparql11-query/>

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further](#)[Reading](#)

Describing a resource

Simple query that can be used when no information about a graph's content is available.

Example 1

```
DESCRIBE <http://dbpedia.org/resource/Concordia_University>
```

Example 2

```
PREFIX geo: <http://www.w3.org/2003/01/geo/wgs84_pos#>
PREFIX xsd: <http://www.w3.org/2001/XMLSchema#>
DESCRIBE ?s
WHERE { ?s geo:lat "45.497002"^^xsd:float .
      ?s geo:long "-73.578003"^^xsd:float . }
```

Public SPARQL Endpoint

→ Worksheet #3: Task 5

Probably the most widely used type of SPARQL query

- Select triples from a graph that match a given **triple pattern** 从图形中选择符合给定三联模式的三联。
- Like an RDF triple, except subject, predicate, and/or object may be a **variable**

Select... where

Select: some details

René Witte

DISTINCT

Use SELECT DISTINCT to remove redundant triples

ORDER BY

Use ORDER BY to sort the result triples (e.g., ORDER BY ?amount)

LIMIT

Use LIMIT to restrict the number of results (e.g., LIMIT 10)

Functions

You can use functions like AVG(), MIN(), MAX(), COUNT(), SUM(), e.g.,

```
SELECT (MAX(?amount) as ?maxAmount)  
WHERE { ?meal e:amount ?amount . }
```

Example (using the Gene Ontology)

“Find me the cellular processes that are either integral to or a refinement of signal transduction.”

```
PREFIX go: <http://purl.org/obo/owl/GO#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX obo: <http://www.obofoundry.org/ro/ro.owl#>

SELECT DISTINCT ?label ?process
WHERE {
  { ?process obo:part_of go:GO_0007165 }      # "integral to"
    UNION
  { ?process rdfs:subClassOf go:GO_0007165 } # "refinement of"
  ?process rdfs:label ?label
}
```

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

Optional Information

Use the `OPTIONAL` keyword to match optional information, e.g.,

```
prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
prefix foaf: <http://xmlns.com/foaf/0.1/>
```

```
select ?name ?url
where {
    ?person foaf:name ?name .
    OPTIONAL { ?person rdfs:seeAlso ?url }
}
```

- This will return a person's URL, if there is one
- Without the `OPTIONAL`, persons without URLs would not have been matched

Reading

Filtering Information

Use a `FILTER` to remove results that were matched by WHERE, e.g.:

```
PREFIX dbr: <http://dbpedia.org/resource/>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?comment
WHERE {
    dbr:Linked_data rdfs:comment ?comment .
    FILTER (lang(?comment) = "en")
}
```

筛选language tag为English的

- Here, we restrict all matched abstracts to those with an English language tag.
- `FILTERs` can operate on numbers, strings, dates, URIs, or other data types and support regular expressions.

Constructing a new graph

Can be used to re-construct a new graph from an existing one.

- For example, re-write triples from one vocabulary into another

Construct a new graph

```
CONSTRUCT { ?isbn b:price ?price.
            ?isbn a:author ?y. ?y a:name ?name . }
WHERE { ?isbn a:price ?x. ?x rdf:value ?price. ?x p:currency ?currency .
       ?isbn a:author ?y. ?y a:name ?name .
       FILTER(?currency == :€) }
```

Notes and Further Reading

Asking a true/false question

`ASK <graph pattern>`

Returns `true` if the pattern can be matched in the graph, otherwise `false`

Example

Is Concordia University located in Mexico?

`PREFIX dbr: <http://dbpedia.org/resource/>`

`PREFIX dbo: <http://dbpedia.org/ontology/>`

```
ASK {  
    dbr:Concordia_University dbo:country dbr:Mexico  
}
```

`PREFIX dbr: <http://dbpedia.org/resource/>`

`PREFIX dbo: <http://dbpedia.org/ontology/>`

`ASK {`

`dbr:Concordia_University`

`dbo:city`

`dbr:Montreal`

`}`

→ Worksheet #3: Task 9

[Notes and Further](#)

[Reading](#)

Other SPARQL features

- ▶ Limit the number of returned results; remove duplicates, sort them, ...
- ▶ Specify several data sources (via URI-s) within the query
- ▶ Construct a graph combining a separate pattern and the query results
- ▶ Use datatypes and/or language tags when matching a pattern
- ▶ Aggregation of the results (min, max, average, etc.)
- ▶ Path expressions (a bit like regular expressions)

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

SPARQL usage in practice

- ▶ SPARQL is usually used over the network
 - http request is sent to a SPARQL endpoint
 - result is the result of the SELECT, the CONSTRUCT,...
- ▶ Separate documents define the protocol and the result format
 - SPARQL Protocol for RDF with HTTP and SOAP bindings
 - SPARQL results in XML or JSON formats
- ▶ Big datasets usually offer “SPARQL endpoints” using this protocol

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

Remote query/reply example

```
GET /qps?&query=SELECT+...+WHERE+... HTTP/1.1
User-Agent: my-sparql-client/0.0
Host: my.example

HTTP/1.1 200 OK
Server: my-sparql-server/0.0
Content-Type: application/sparql-results+xml

<?xml version="1.0" encoding="UTF-8"?>
<sparql xmlns="http://www.w3.org/2005/sparql-results#>
  <head>
    <variable name="a"/>
    ...
  </head>
  <results>
    <result ordered="false" distinct="false">
      <binding name="a"><uri>http:...</uri></binding>
      ...
    </result>
    <result> ... </result>
  </results>
</sparql>
```

SPARQL 1.1 Update

- ▶ SPARQL CONSTRUCT returns a new, modified graph
 - the original data remains unchanged!
- ▶ SPARQL 1.1 Update *modifies the original dataset!*

RDF Dataset

An RDF dataset may have multiple named graphs and at most one unnamed ("default") graph.

Serialization

TriG: Extension of [Turtle](#) for named graphs
See <https://www.w3.org/TR/trig/>

N-Quads: Extension of [N-Triples](#) for named graphs
See <https://www.w3.org/TR/n-quads/>

[Introduction](#)[Review](#)[OWL](#)[Queries](#)[SPARQL Queries](#)[Introduction](#)[Describe](#)[Select](#)[Construct](#)[Ask](#)[Other SPARQL Features](#)[SPARQL Protocol](#)[Named Graphs](#)[Serving Knowledge Graphs](#)[Inferencing](#)[Notes and Further Reading](#)

TriG Example

René Witte

BASE <http://example.org/>
PREFIX ...

此处有两个named graph

① GRAPH <http://example.org/bob>

```
{  
    <bob#me>  
        a foaf:Person ;  
        foaf:knows <alice#me> ;  
        schema:birthDate "1990-07-04"^^xsd:date ;  
        foaf:topic_interest wd:Q12418 .  
}
```

② GRAPH <https://www.wikidata.org/wiki/Special:EntityData/Q12418>

```
{  
    wd:Q12418  
        dcterms:title "Mona Lisa" ;  
        dcterms:creator <http://dbpedia.org/resource/Leonardo_da_Vinci> .
```

```
<http://data.europeana.eu/item/04802/243FA8618938F4117025F17A8B813C5F9AA4D619>  
    dcterms:subject wd:Q12418 .
```

```
}
```

```
<http://example.org/bob>  
    dcterms:publisher <http://example.org> ;  
    dcterms:rights <http://creativecommons.org/licenses/by/3.0/> .
```

Apache Jena Fuseki

Apache Jena Fuseki is a SPARQL server. It can run as a operating system service, as a Java web application (WAR file), and as a standalone server. It provides security (using [Apache Shiro](#)) and has a user interface for server monitoring and administration.

It provides the SPARQL 1.1 [protocols for query and update](#) as well as the [SPARQL Graph Store protocol](#).

Fuseki is tightly integrated with [TDB](#) to provide a robust, transactional persistent storage layer, and incorporates [Jena text query](#). It can be used to provide the protocol engine for other RDF query and storage systems.
